

SUSTAINABLE

How DHL is reducing its greenhouse gas emissions.

Which emission reduced solutions customers can use.

How DHL makes reporting easy for companies.

TIME TO DELIVER

Climate change is an urgent issue that demands immediate action. At DHL Group, we are committed to addressing this challenge head-on. This brochure highlights the concrete steps we are taking to reduce our environmental footprint and the low-emission solutions we offer our customers.

Transitioning to a low-carbon economy quickly is essential.

While logistics is inherently carbon-intensive and new technologies can be costly, we are focused on implementing what is technically feasible and commercially viable now.

We don't wait. We are taking decisive action across all areas of our operations and investing ahead of the curve to encourage supplier innovation and scale decarbonized solutions.

Our efforts are aimed at offering emission-reduced logistics. We invite you - our customers, policymakers, industry peers, and partners - to join us in action now.

Find out everything about our sustainability approach here.

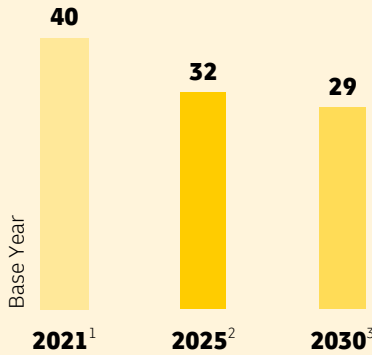

1 Facilities GHG emissions Scope 1 and 2 in 2025. | 2 Also includes locations that are only certified according to one ISO. | 3 In accordance with the internal DHL Group framework (based on the World Green Buildings Council's guidance, certified by SGS). Deviations permitted in justified exceptional cases. | 4 Carbon-Neutral Building refers to a DHL internal rating standard for building emissions. It includes buildings' operational carbon emissions according to Scope 1 and Scope 2, with 75% or more carbon reduction and a maximum of 25% offsets with verified carbon credits allowed (compared to a baseline where fossil energy is used for electricity and heating). The reduction of emissions is achieved by renewable energies, like solar PV, and the deployment of energy efficient technologies.

Figures

SUSTAINABILITY IN FIGURES

Every year is an important
step towards low-emission
logistics.

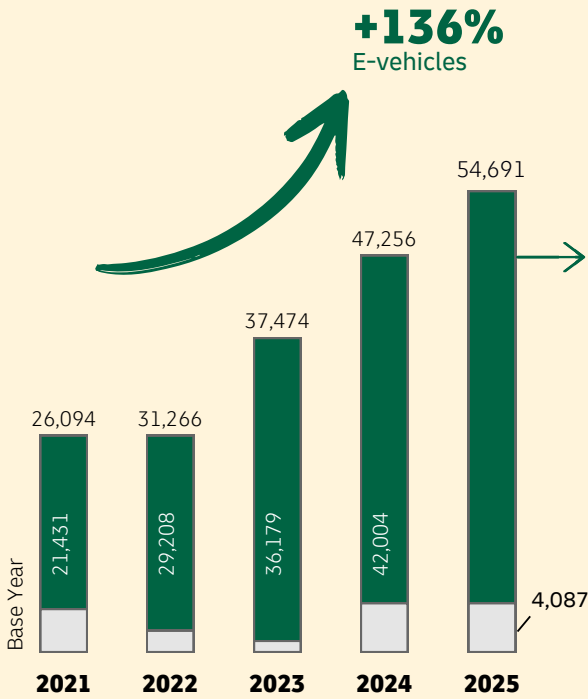

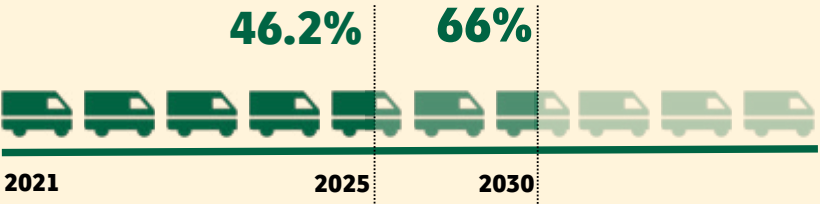

**GREENHOUSE GAS (GHG) EMISSIONS
(WELL-TO-WHEEL)**
Million metric tons CO₂e

1 Includes the effect from the acquisition of the Hillebrand Group in fiscal year 2022, recognized starting in the 2022 Annual Report. | 2 From financial year 2025 including reduction effects from market-based processes. | 3 Subject to potential restatement due to methodology updates or changes in business scope, e.g. due to M&A.

**ALTERNATIVE DRIVE TYPES FOR THE
ROAD VEHICLE FLEET**

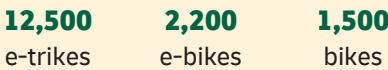

E-vehicles in service for pickup and delivery

50,604
e-vehicles in use

16,200
bicycles of which

Unless otherwise stated, all figures refer to the year 2025.

CUSTOM-FIT SOLUTIONS

Best Practice

We are walking the path of
decarbonization with our
customers across transport modes
and countries around the world.
The results speak for themselves.

MYTHERESA

27,000

metric tons of CO₂e
emissions reduced

Our partnership with luxury e-commerce platform Mytheresa enables a **reduction of 27,000 metric tons of CO₂e emissions** over five years using Sustainable Aviation Fuel (SAF) through our GoGreen Plus service instead of conventional jet fuel.

CLAIRE'S ACCESSORIES

127

metric tons recycled
waste packaging

Together with our customer Claire's Accessories, we have implemented an onsite closed-loop packaging solution **to recycle cardboard packaging waste** and turn into base cartons for their new stock.

→ dhl.com/sustainability

customer
stories
here.

DM

9,400

metric tons CO₂e
emissions reduced

For drugstore chain dm, we send 11.0 million parcels and 14.7 million advertising mailings per year using GoGreen Plus, delivering an annual **reduction of around 9,400 metric tons CO₂e** in 2025.

SCHNEIDER ELECTRIC

We designed a multimodal shipping solution for Schneider Electric - a world leader in energy management and automation - that combines air and sea transport, **reducing GHG emissions by 20%.**

20%

FORMULA 1

83%

We increased our fleet of biofuel-powered trucks for delivering Formula 1® consistently from 2023 onwards to a total of 52 trucks, achieving an average **83% reduction in GHG emissions per truck** compared to its diesel-fueled counterpart.

Pickup and delivery

MEET OUR E-FLEET

We aim to keep greenhouse gas emissions as low as we can when picking up and delivering shipments to end customers. With more than 50,000 electric vehicles, we have one of the world's largest e-fleets among logistics companies*. In addition, we deployed 14,700 e-trikes and e-bikes in 2025.

TARGET
Electrify more than 2/3 of
our pickup and delivery
vehicles by 2030

Line Haul

Electric power is the most sustainable long-term solution for heavy-duty trucks. However, we also need alternative technologies to reduce greenhouse gas emissions now.

YOUR ROAD TO NET ZERO

In road transport, we are achieving short-term emission reductions while promoting and piloting long-term emission reduced technologies.

→ dhl.com/delivered

Find a deep dive into line haul decarbonization here.

TARGET
Increase sustainable fuels and electrification share to >30% by 2030.

HVO

HVO (Hydrotreated Vegetable Oil) is produced from used cooking oils and other organic waste materials. It can be blended and used in diesel engines in selected countries.

GHG Emissions Reduction

Up to **90%**

Bio-CNG/-LNG

A natural gas produced from anaerobic digestion of organic waste, it is typically either LNG (liquid) or CNG (compressed).

GHG Emissions Reduction

Up to **80%**
depending on the feedstock

Rail

Several routes for DHL Group Ground Transport in Europe are multimodal. This means that shipments are transported as far as possible by rail, with the remaining distance covered by truck.

GHG Emissions Reduction

80 - 100%
ensuring the journey is powered by renewable energy sources.

Battery Electric

Battery-powered electric vehicles are the most energy-efficient option among low-emission solutions. Grid capacity is the main hurdle here.

GHG Emissions Reduction

Up to **100%**
if the power comes from renewable sources

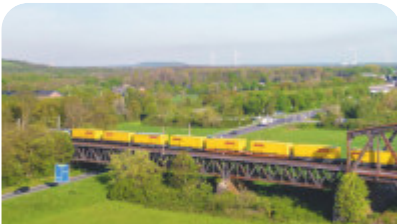

Hydrogen

Hydrogen vehicles offer impressive range and quick refueling over long distances, but still need further trials.

GHG Emissions Reduction

Up to **100%**
when producing hydrogen with electricity from renewable sources

→ Our route planner assesses whether specific routes can be operated with sustainable fuels or other low-emission drive technologies.

Selected use cases

- Approximately 20 million liters of HVO deployed in 2025 for DHL Supply Chain in UK
- 200 trucks powered by HVO in the DHL Freight Sweden network

Selected use cases

- Expansion of our own fuel station infrastructure with approx. 250 Bio-LNG/CNG trucks in UK for DHL Supply Chain
- 570 trucks in Post & Parcel Germany, supported by DHL Freight operations
- 50 Bio-CNG vehicles in operation for Tesco in Ireland

Selected use cases

- Increasingly shifting volumes from road to rail
- 35 to 41 containers per week on rail from Asia to Germany and Great Britain for adidas
- 8 trains per week for P&P

Selected use cases

- About 370 electric trucks (from 7.5 to 60 tons) in use globally
- Tested and implemented Electric Range Extender Solutions to bridge gaps in charging infrastructure
- Volvo FL Electric 16t delivering palletized goods to Frankfurt, Cologne, Hamburg, and other German cities (> 100 km per day)

Selected use cases

- DHL Freight is testing hydrogen combustion engines and fuel-cell technology in Germany and Netherlands
- First hydrogen pilot successfully completed (27t Box Body Rigid with mobile H₂ refueler)
- Further pilots in Japan and Saudi Arabia

Air Transport

In 2025, we used 185 kilotonnes (kt) of Sustainable Aviation Fuel (SAF) in our own fleet. This corresponds to a 10% blending ratio - our highest share yet - nearly tripling the 2024 ratio of 3.5%. We also collaborate with our airline partners to scale SAF use significantly across our Scope 3 air transport operations.

#1 TOPIC

All you need to know about SAF

Benefits

Sustainable Aviation Fuel (SAF) is an aviation fuel made from sustainable feedstocks such as used cooking oil and other residues. **We only use fuels with external sustainability certification.**

SAF can reduce emissions by **around 80%** over the entire life cycle compared to conventional jet fuel.

Up to 50% SAF content can be blended into conventional jet fuel without the need to convert aircraft.

Battery electric and hydrogen technologies are being researched; however, there is currently no alternative to hydrocarbon-based fuels on the horizon for long distance flights.

Scaling up SAF is critical because:

- SAF is available at short term.
- SAF can use the existing infrastructure.

Challenges

The availability of waste oils and other sustainable residues for SAF production is limited and expensive. Alternative feedstocks might make sense if they do not compete with food production.

SAF currently accounts for **less than 1%** of all aviation fuels consumed.

Planned production capacities will provide **1-2% of jet fuel** demand by 2027.

Our challenges:

- We want to make SAF available to our customers on a long-term and predictable basis.
- We want to ensure that our SAF is made from sustainable feedstock.
- We want to reconcile sustainability and economic efficiency.

→ dhl.com/delivered

Find out more about SAF solutions here.

The greatest potential - and the greatest challenge - lies in decarbonizing air and ocean transport. While we aim to reduce fuel consumption by increasing operational efficiency and using innovative technologies, sustainable fuels will play a fundamental role in the coming years.

TARGET
 >30% share of sustainable fuels in air and ocean by 2030.

5 things you need to know about Sustainable Marine Fuel (SMF)

1 Sustainable Marine Fuel (SMF) can reduce GHG emissions by **around 85%** (green ammonia and other power-to-liquid fuels can achieve up to 100%) compared to conventional marine fuels.

SMF are naturally low in sulphur and produces **fewer air pollutants** such as sulphur oxides.

2 To procure reductions leveraging SMF, we rely on our **network and strategic partnerships** in the industry.

GoGreen Plus leveraging SMF can be selected for both LCL (less than container load) and FCL (full container load) shipments via **myDHLi Quote + Book** or via your DHL Global Forwarding account manager. GoGreen Plus is available at different service levels, enabling customers to choose the level of decarbonization that matches their goals.

3 Swedish fashion brand Lindex was the first company to book **GoGreen Plus for FCL Ocean Freight** - becoming a pioneer in low-emissions fashion logistics.

Actions

Buying the SAF currently available is essential for us. In addition, with GoGreen Plus we **help customers meet their Scope 3 targets**. GoGreen Plus uses 'book & claim' to track and transfer emission reductions from sustainable fuels across the value chain.

We sign multi-year contracts with SAF producers such as: Neste, BP, Philips 66 and SAF One to secure supply.

In 2025, we achieved a 10% SAF blending ratio in our own aircraft, the highest in years and nearly three times the 2024 level (3.5%).

To decarbonize aviation, we have a clear list of further measures:

- Accelerated re-fleeting by investing in the latest technology and the most fuel-efficient aircraft.
- Implement fuel optimization program with multiple measures.

POWERHOUSE

One part of the supply chain that should not be overlooked is the warehouse footprint. We deploy energy-efficient technologies, energy from renewable sources, and other emission reduction alternatives.

Buildings

Environment

- Natural landscaping (biodiversity)
- Rainwater harvesting
- Low water use buildings

Building Automation & Metering

- Enhanced building automation
- Main meter energy monitoring
- Sub meter advanced energy monitoring

Renewable & Renewable Ready

- Solar panels (PV)
- Solar ready roof
- Battery storage ready
- Purchased renewable energy from the grid

Lighting

- LED lighting with smart control system
- Vertical skylights

Electrical Infrastructure

- Charging stations for operating vehicles
- Charging stations for e-vehicles (cars)
- Efficient transformers

Heating & Cooling

- Efficient HVAC (Heat pumps)
- Natural ventilation, automated control
- Sun protection/shading
- Efficient dock seals
- Rapid rise doors

Explore more about standard decarbonization levers here.

WE HANDLE YOUR SCOPE 3

From direct fuel switching to innovative technologies, our logistics solutions can support the decarbonization of your Scope 3 emissions - the choice is yours.

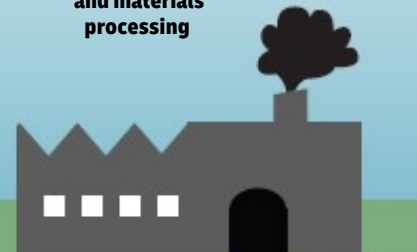

Scope 2 INDIRECT SOURCES

Emissions from purchased electricity or own use

Scope 1 DIRECT SOURCES

Onsite energy consumption and materials processing

Company-owned vehicles

Scope 3 UPSTREAM AND DOWNSTREAM SOURCES

Processing of sold products

Upstream and downstream transportation and distribution

Air transport

End-of-life treatment of sold products

Investments

Use of sold products

DHL's logistics services support the decarbonization of our customers' Scope 3 emissions.

The Greenhouse Gas Protocol (GHGP) Corporate Standard classifies a company's emissions into three 'Scopes'.

Scope 1 covers the **direct emissions** a company produces through its own operations or sources it controls.

Scope 2 covers the **indirect emissions** associated with the company from the generation of the electricity and heating energy they purchase and use.

Scope 3 includes all the **other indirect emissions that occur in a company's value chain** – including any up- or downstream emissions from transportation and distribution.

This is only a selection of categories, especially in Scope 3

REDUCING CUSTOMER EMISSIONS

To support our customers' decarbonization efforts, DHL introduced GoGreen Plus in 2021. GoGreen Plus products are based on true value chain decarbonization – **insetting** – rather than carbon compensation or offsetting.

The mechanism we employ for our insetting products is called 'book & claim'. Book & claim enables us to directly replace fossil fuels with low-carbon fuels and alternative technologies within our network and allocate environmental benefits to paying customers, even when their shipments are not physically transported with these emission reduced assets.

This means we can help reduce the environmental impact throughout our own supply chain, in the air, across the ocean, and on the road. We can also provide solutions for dedicated local operations in warehousing and transportation.

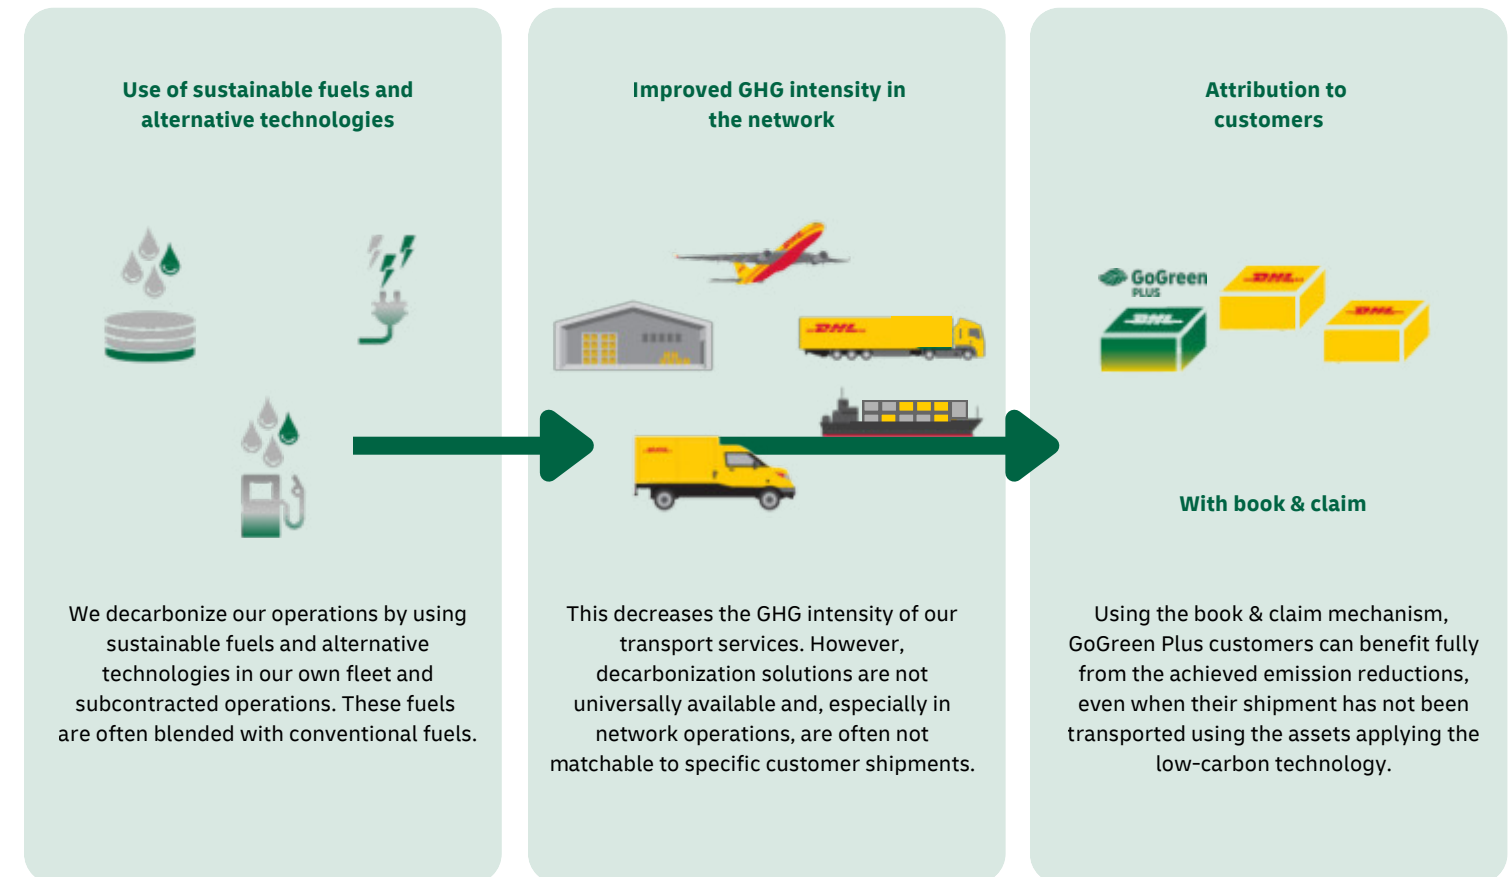

Overview of GoGreen Plus products & services

GoGreen Plus is a value-added service to a DHL shipment, contributing to decarbonization measures within DHL's logistics network. By using alternative fuels and/or technologies, DHL reduces the use of fossil fuels in the mode of transport used for the GoGreen Plus shipment. This does not necessarily mean that the specific shipment is physically transported with the assets using these fuels or technologies. Further information – for example, on specific decarbonization measures – can be found via the QR code on the next page.

DHL approach to insetting of our network business

Reduction within our network can be attributed to individual shipment

GoGreen Plus services offer you a number of key benefits:

→ dhl.com/delivered

Find more information about book & claim here.

1 You may share our determination to reduce your GHG emissions and our understanding that it is worth paying a premium to achieve this. **GoGreen Plus enables you to act on this commitment.**

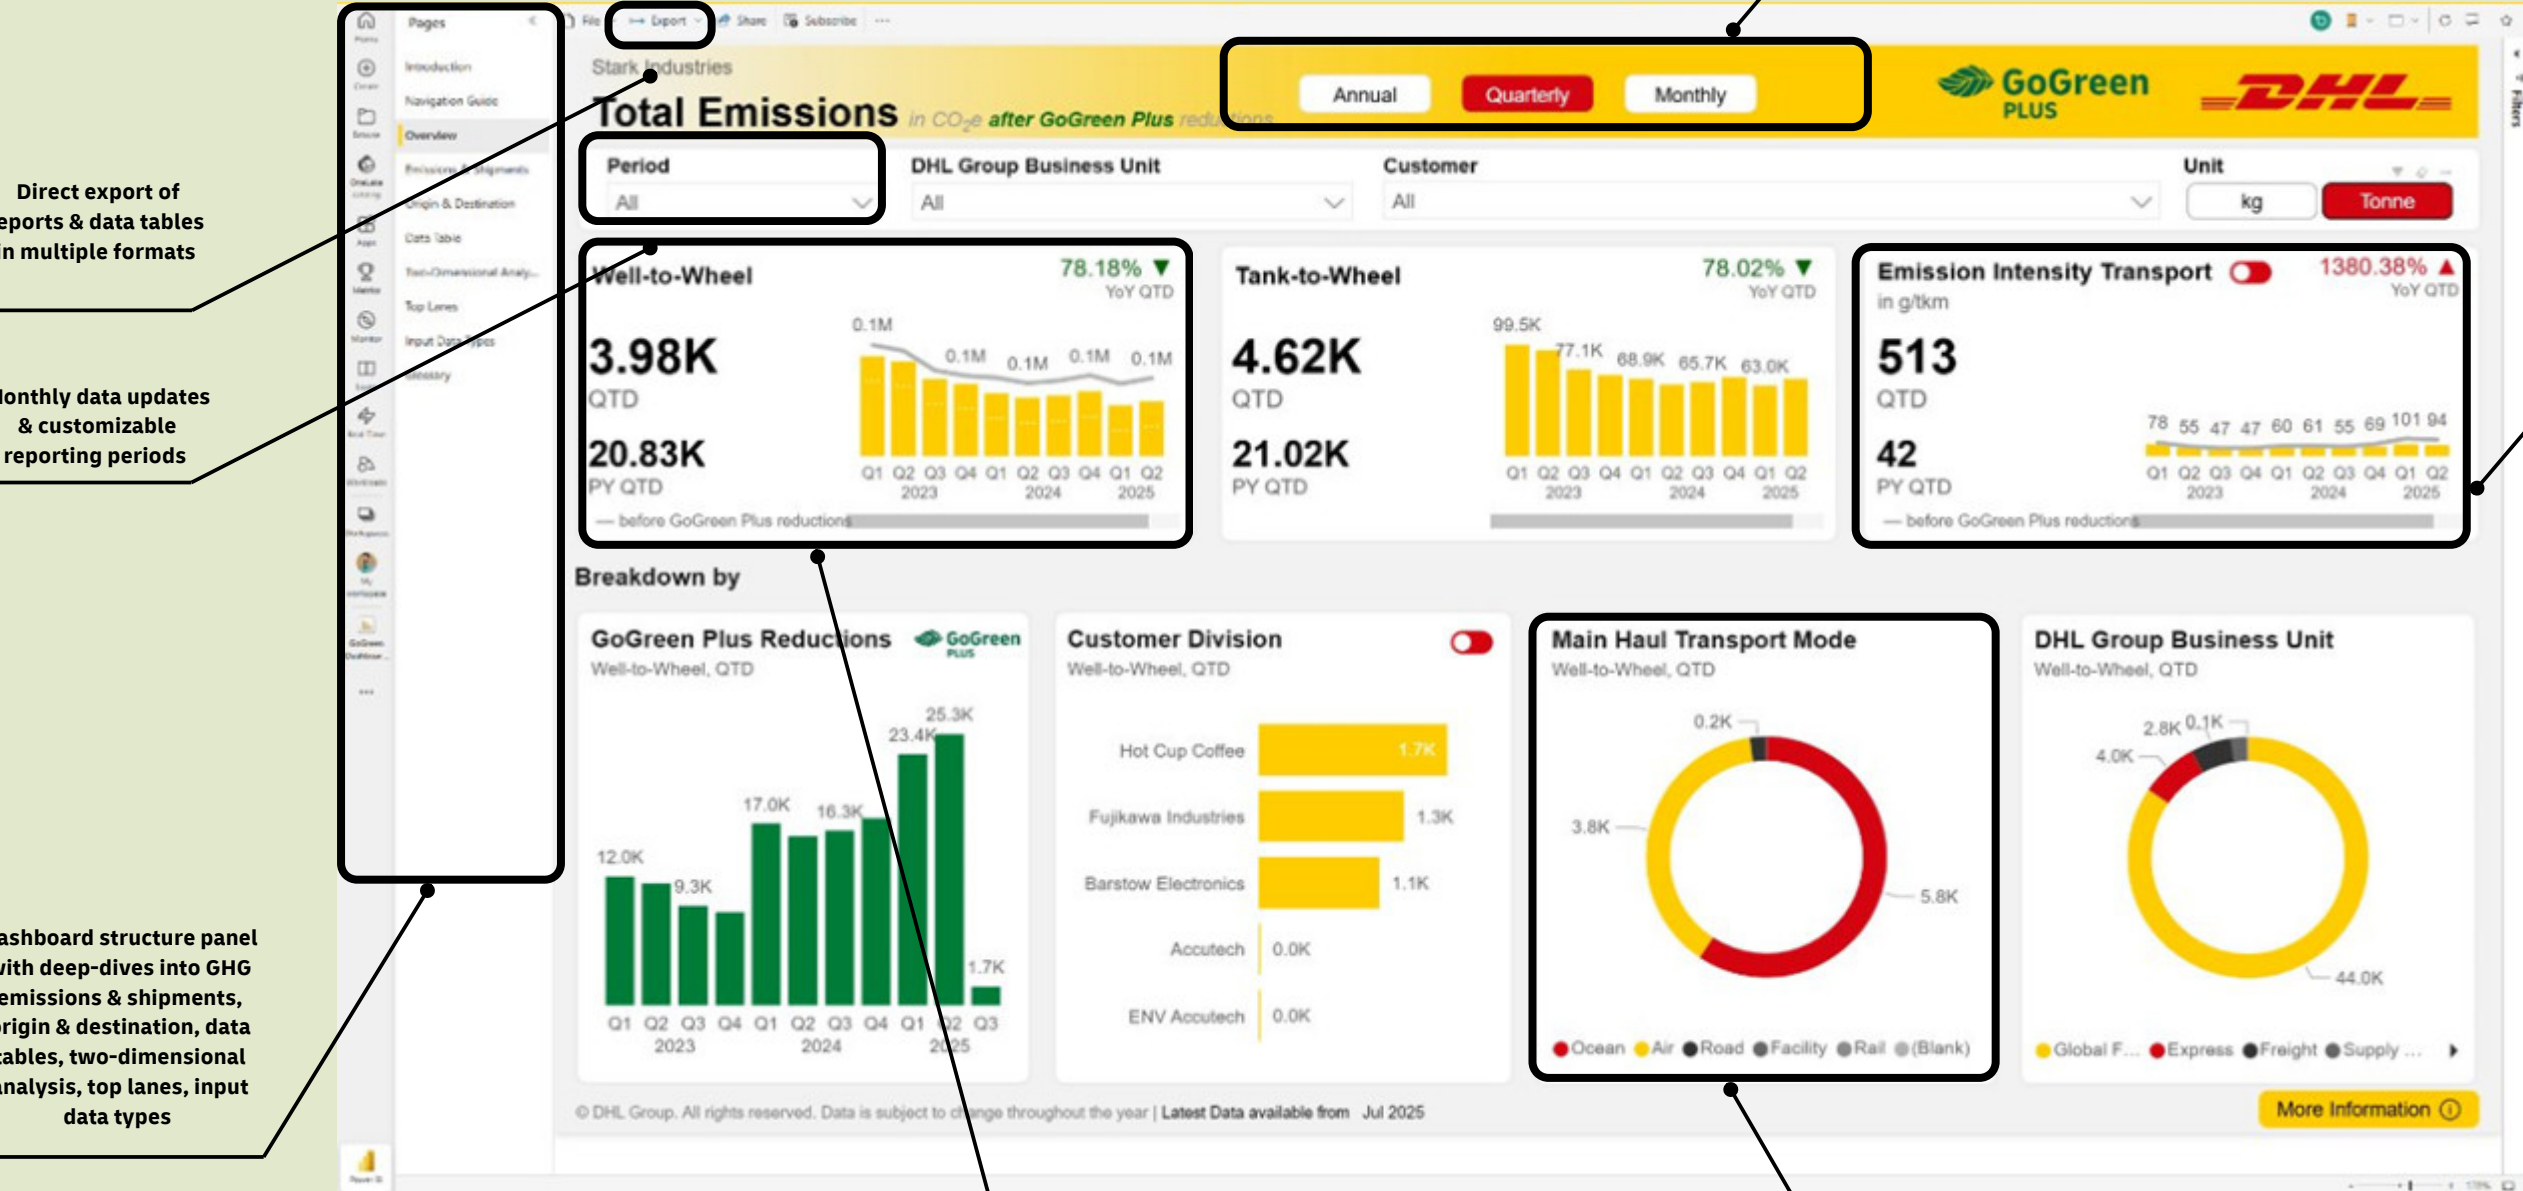

2 You have decarbonization targets you need to hit, **GoGreen Plus can play an important role in helping you.**

3 You are reporting your Scope 3 emissions, the 'book & claim' mechanism and **the certificates we issue are proof points to support your voluntary reporting.**

4 You can communicate your use of GoGreen Plus – and the benefits of using it – to your own customers, **enhancing your reputation** and increasing your customers' willingness to pay a premium as well.

THE BOTTOM LINE

We not only take the transparent reporting of our own GHG emissions very seriously, but also support our top 100 global¹ customers in doing so.

¹ For other customers, we provide support through individual carbon reports or the GoGreen Dashboard for EXP customers.

Total GHG emissions figures, compliant with the ISO14083 Standard and the Global Logistics Emissions Council (GLEC) Framework

THE WHOLE STORY

Decarbonize now – we are looking at every link in the supply chain and finding ways to reduce the emissions and make sustainable solutions commercially viable.

1) Carbon-Neutral Building refers to a DHL internal rating standard for building emissions. It includes buildings' operational carbon emissions according to Scope 1 and Scope 2, with 75% or more carbon reduction and a maximum of 25% offsets with verified carbon credits allowed (compared to a baseline where fossil energy is used for electricity and heating). The reduction of emissions is achieved by renewable energies, like solar PV, and the deployment of energy efficient technologies.

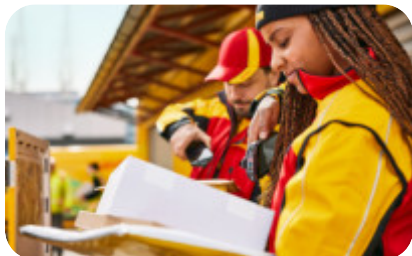

→ dhl.com/sustainability

Before we take a step **forward together** - maybe a step back will help you to learn more about sustainable logistics first. We've provided everything you need to know to get started - from industry terminology to information on the latest decarbonization technologies.

Find out more about our emission reduced logistics here.

If the idea of decarbonizing your supply chain with DHL interests you:

1. Select GoGreen Plus per shipment (manually) when creating a shipment in our shipping applications. Ideal for ad-hoc transactions.

2. Immediately start to reduce the GHG emissions associated with all your shipments using our standard emission reduced product offerings with a simplified pricing model and pre-set GHG reduction percentage. Most suitable for volume shipping.

3. Request a customized offer based on your exact reduction targets and shipping profile. This option offers full flexibility and multiple investment and billing models, including the joint development of a tailored emission reduced logistics solution. Reach out to your sales representative to find out more.
